

Socially Intelligent Infrastructure

Vision and Challenges in a Sociotechnical Systems Perspective

Sociotechnical Systems

Current AI research: atomistic, single-agent decision-making focused on ethical dilemmas

Current social sciences research: Not computational in outlook

Values: Largely Universal Motivations and Goals

Values: mental representations of beliefs and goals; provide vocabulary for social interaction to achieve cooperation

Maslow's hierarchy of needs

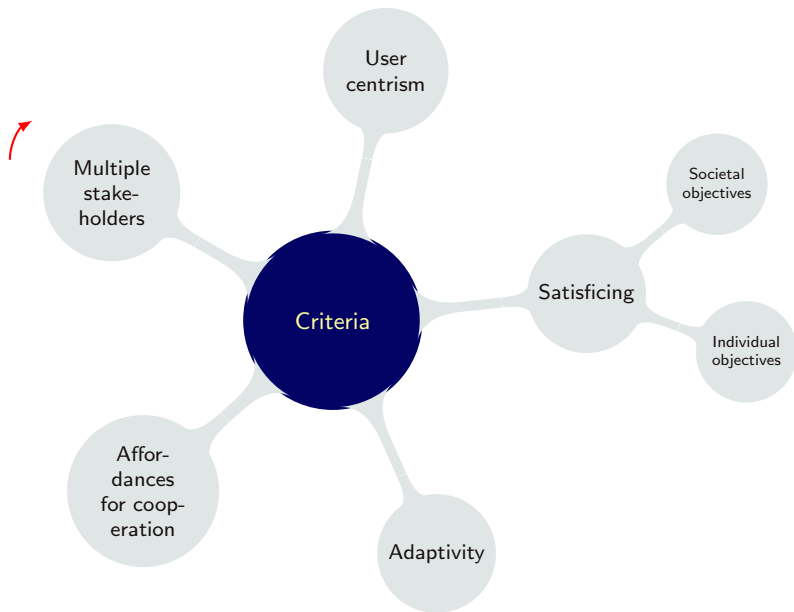

- ▶ Biological organisms
- ▶ Coordinated social interaction
- ▶ Survival and welfare of groups

Socially intelligent infrastructure

- ▶ Embodies human values and interactions
- ▶ Treats end users as active entities
- ▶ Adapts at multiple timescales

Socially Intelligent Infrastructure: Criteria

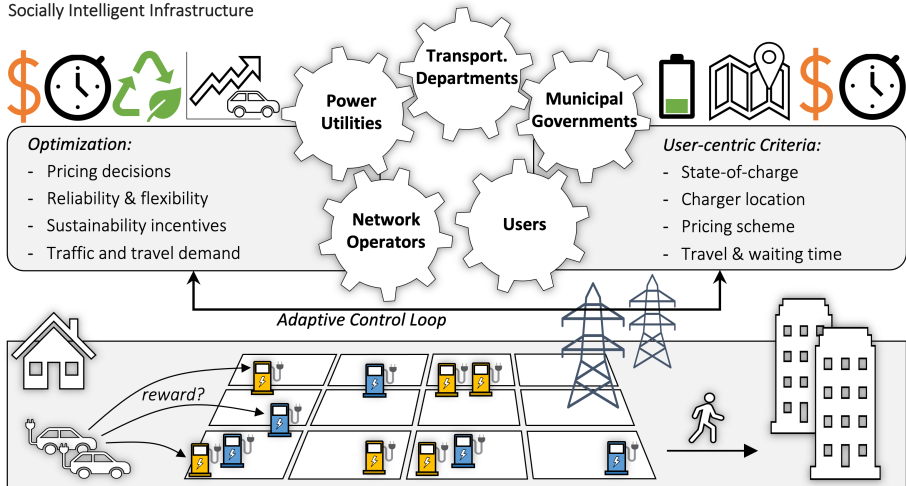

Infrastructure for Electrical Vehicle Charging

Multiple stakeholders with partially aligned objectives

Understanding both user and societal objectives

Socially Intelligent Infrastructure

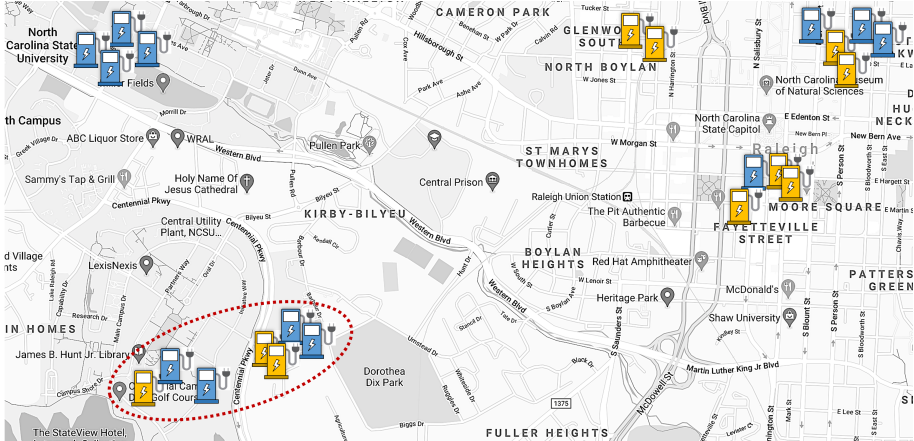

Lika Charging App: A Conception

Possible screen for user request entry

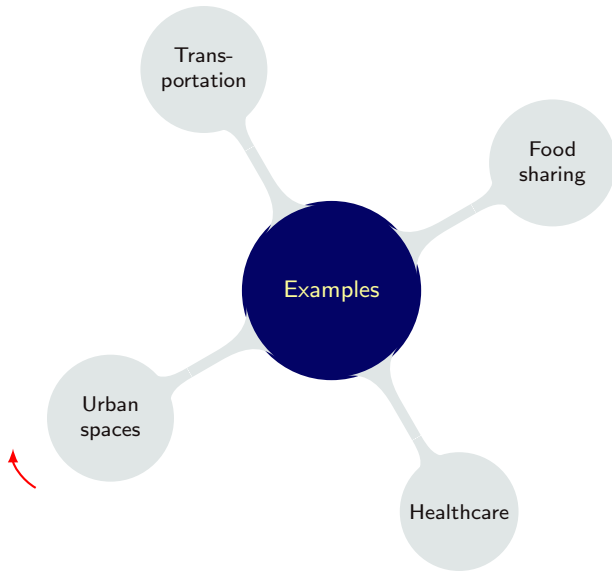

Transparency and explanations to the user

Ability to nudge users toward prosocial choices to shape demand

Socially Intelligent Infrastructure: Examples

Socially Intelligent Infrastructure: Ingredients

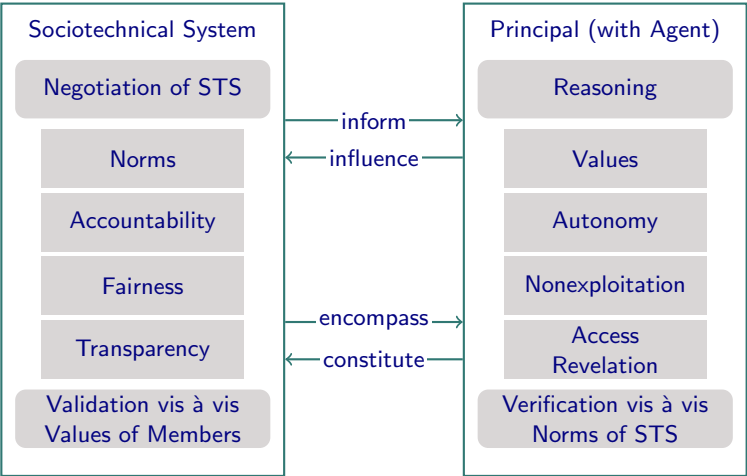

Challenge: Governance of Socially Intelligent Infrastructure

Continually align sociotechnical systems and principals

Judgments of ethicality of STS: Relative to principals' values

Judgments of compliance by principals: Relative to STS

Challenge: Accountability for Resilience and Innovation

Accountability: ≥ 2 parties: one to call another to account for its actions

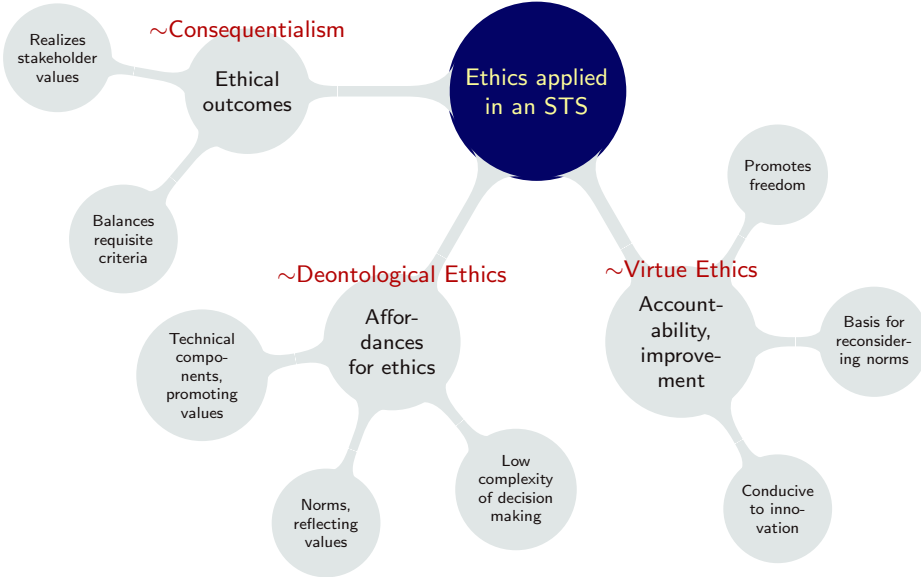

Alternatives vary on accountability

- ▶ Explanations and arguments to override prima facie expectations
- ▶ Not blame and sanction: subsequent to accounting
- ▶ Not traceability: a supporting mechanism

Challenge: Ethics in the Infrastructure

Values, outcomes, and accountability from a sociotechnical perspective
